                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                           The present sequence represents a secreted protein. The polymucleotide and secreted protein are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating activity, tissue svaccines) or suppressing activity, haematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, activin/inhibin activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, anti-inflammatory activity and because special properties of the specification to support these activities). The polynucleotide is also stated to be useful for gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents a human junctional adhesion molecule 2 (JAM2). The polymucleotide encoding the polypeptide is useful for recombinant production of JAM-2 protein, which in turn is useful for the production of antibodies. The antibodies may be used for probing cellular localisation and/or expression of JAM2 in tissues under normal and disease states, for immunoprecipitating JAM2 protein from cells and/or stroke tissues to determine whether it is modified by glycosylation and phosphorylation, and for determining JAM2 function. The antibodies inhibit interaction of JAM2 with inflammatory cells or influences their paracellular migration, and is therefore useful for alleviating inflammatory diseases such as arthritis, asthma, rheumatoid arthritis, inflammatory bowel disease and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        241 IAAVVVVALVISVCGLGVCYAQRKGYFSKETSFQKSNSSSKATTMSENDFKHTKSFII 298

such as asthma or other respiratory problems. (II) is useful to express recombinant protein, as markers for tissues in which the corresponding protein is preferentially expressed and in gene therapy. The present sequence is that of a polypeptide of the invention.

2002-582343/62 N-PSDB; ABQ92017 Novel secreted or transmembrane protein and polynucleotide encoding the protein, useful for diagnosis and treatment of neurological disorders, cancer, autoimmune diseases, bone disorders and lung or liver fibrosis

Claim 54; Page 116-117; 284pp; English.

The invention relates to human secreted or transmembrane protein (1), their fragments and is encoded by specific complementary deoxyribonucleic caid (CDNA) inserts (II), where the protein is substantially free from cother mammalian proteins. (I) are useful for preventing, treating or meliorating a medical condition, cepecially immunological treatment or conference (II) are useful for preventing, treatment or conference (II) are useful factor artinflammatory, stem cell proliferation, cell differentiation, antinflammatory, cytokine, cell proliferation, cell differentiation, antinflammatory, conference (II) can be used to manipulate stem cells in culture to give contropithelial cells that can be used to augment or replace cals damaged by illness, autoimmune disease, accidental damage or rise to neuroepithelial cells that can be used to augment or replace contropithelial cells that can be used to augment of nerve and brain tissue and is useful for the treatment of genetic disorders. (I) induces the proliferation of neural cells and central and peripheral nervous system diseases and neuropathies, such as a certain and peripheral nervous system diseases and neuropathies; contact and peripheral nervous system diseases and neuropathies; cativity, regulation of haematopoiesis and is useful for treating myeloid cell disorders, platelet disorders such as thrombocytopaenia contingue growth and in tissue repair, healing of burns, incisions, incision or tesure combined disorders, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Soppet
  This sequence represents a secreted human protein encoded by the gene fullone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAV34277) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 28 novel genes and their fragments (nucleic acid sequences: AAV34245; amino acid sequences AAV354596-V34325; amino acid sequences AAV35496-V34335) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 28 polynucleotides, based on which tissues they are most highly expressed in (see AAV34286 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LEWKKLGRSVSFVYYQQTLQGDFKNRAEMIDFNIRIKNVTRSDAGKYRCEVSAPSEQGQN 120

Abb44636-AAb44676 represent cDNAs corresponding to 28 human secreted protein genes, and AAE26959-AAE2699 represent the proteins they encode. AAE37009-AAE37025 represent human secreted protein fragments or their variants. The secreted proteins and genes estul fragments or their variants. The secreted proteins and genes engeful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Specific uses are described for each of the 28 genes, based on the tissues in which they are most highly expressed and include developing products for the disgnosis or treatment of immunodeficiencies, e.g., X-linked agammaglobulinaemia, B cell immunodeficiencies, severe combined immunodeficiencies autoimmune disorders e.g., systemic lupus erythematosus, rheumatoid arthritis, multiple solerosis, autoimmune trythematosus, rheumatoid arthritis, multiple solerosis, autoimmune crythematosus, rheumatoid arthritis, multiple solerosis, autoimmune crythematosis, autoimmune haemolytic anaemia, Goodpasture's syndrome, crave disease, diabetes mellitus, dermatitis, inflammatory conditions including septic shock, sepsis, reperfusion injury, inflammatory bowel disease, crohn's disease, haematopoletic disorders, respiratory disorders e.g., asthma and allergy, gastrointestinal disorders e.g.,
respiratory disorder; asthma; allergy; gastrointestinal disorder; inflammatory bowel disease; neurodegenerative disorder; hepatitis; parkinson's disease; Alzheimer's disease; carddovascular disorder; atherosclerosis; myocarditis; renal disorder; fungicide; virucide; hyperproliferative disorder; acute glomerulonephritis; tonsilitis; respiratory disorder; rinitis; sinusitis; neurological disease; endocrine disorder; Addison's disease; reproductive system disorder; endometriosis; vasotropic; vulnerary; cytostatic; nootropic; cardiant; anti-HIV; tranquilliser; gout; antiparasitic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human secreted polypeptides and polynucleotides for diagnosing, preventing, treating immune, hyperproliferative, cardiovascular, neurological, reproductive disorders and identifying modulators of

```
protein genes, and AAE27014 represent the proteins becreed
AAE27138-AAE27164 represent human secreted protein fragments. The genes
and their corresponding secreted proteins are useful for preventing,
treating or ameliorating medical conditions, e.g., by protein or gene
therapy. Secreted protein sequences of the invention are useful for the
diagnosis or treatment of disorders such as autoimmune diseases (e.g.
theumatoid arthritis), hyperpoliferative disorders (e.g. neoplasms of
the breast or liver), crebrovascular disorders (e.g. cardiac arrest), nervous
system disorders (e.g. dafaheimer's disease), infections caused by fungi,
angiogenesis), cardiovascular disorders (e.g. cardiac arrest), nervous
system disorders (e.g. Alzheimer's disease), infections caused by fungi,
bacteria and viruses and ocular disorders (e.g. corneal infection). The
polypeptides can also be used to aid wound healing and epithelial cell
proliferation, to prevent skin aging due to sunburn, to maintain organs
to regenerate tissues and in chemocaxis. They can also be used as food
additives or preservative to increase or decrease storage capabilities,
additives or preservative to increase or decrease storage capabilities,
and other mutrificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         components. The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for diagnosing, preventing, treating or ameliorating medical conditions and as food additives or preservatives

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human secreted proteins

(ABR47633-ABR48145) and their coding sequences (ACC50344-ACC50856). The

proteins and their coding sequences are useful for the preparation of a

diagnostic or pharmaceutical composition for diagnosting or treating a

cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest,

coronary arteriosclerosis and myocardial ischaemia), neural disorders,

memune system disorders, muscular disorders, reproductive disorders,

cardiovascular disorders, pulmonary disorders, reproductive disorders,

proliferative disorders and/or cancerous diseases and conditions, for

wound healing and epithelial cell proliferation, to treat inflammation or

cinfection, for treating thrombosis and arteriosclerosis, for treating or

preventing neural damage which occurs in neuronal disorders or

controlled and prince and periodontal regeneration and aid in tissue

can be conditions such as Alzheimer's disease and parkinson's

clisease, to enhance bone and periodontal regeneration and aid in tissue

cransplants or bone grafte, to prevent skin aging or hair loss, to

marrow cells when used in combination with other cyclokines, to maintain

construction and aid or maintain and aid or maintain

construction and aid or maintain and aid or maintain

construction and aid or maintain and aid or maintain

construction and aid or maintain and aid or maintain

construction and aid or maintain and aid or maintain

organs before transplantation or for supporting cell culture of primary tissues, to increase or decrease differentiation or proliferation of embryonic stem cells, or to modulate mammalian characteristics or

```
The invention relates to an isolated polypeptide comprising an amino acid sequence at least 95% identical to sequence of 28 human secreted form, cargence, their fragment, polypeptide domain, epitope, secreted form, variant, allelic variant, polypeptide domain, epitope, secreted form, concluded an ATCC 9721 and 97922. Also included are the encoding encoding the proteins and mucleic acids are useful for disquosing, prognosing or amaliorating a medical condition e.g. treating, prognosing or amaliorating a medical condition of sectors is autoimmune thyroidities, autoimmune thyroidities, autoimmune thyroidities, autoimmune thyroidities, antical manatory bowel disease, disease, habetes shock, sepsias, repertusion injury, inflammatory conditions (e.g. septic shock, cepsis, recental nervous system (CNS) disorders (e.g. septic brain injury and/or stroke traumatic brain injury), neurodegenerative constraint and prior disease, and alsorders (e.g. technic and prior disease), cardiovascular disease, and cardiopulmonary processis, myocarditis, cardiovascular disease, and spease on percentic disorders (e.g. endomenties, general processis, myocarditis, deradions arterial thrombosis, for myocarditis, sarcoidosis, dermatitis, allogenic transplant rejection), hyperpituitarism), liver diseases and disorders (e.g. and pancreatic disorders (e.g. 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human secreted polypeptides and polynucleotides for diagnosing, prognosing, preventing and treating immune, hyperproliferative, liver, kidney, reproductive disorders and for identifying modulators of therapeutic use
                                                                                                                                                                                                                                                                                                                                                       Li Y, Zeng Z, Kyaw H, Fischer CL, Li B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ద
CC invention also encompasses antibodies specific for the secreted proteins, the use of the secreted proteins in drug screening, and recombinant corrected proteins in drug screening, and recombinant vectors and host cells comprising a nucleic acid of the invention. The secreted proteins, nucleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein acityity are useful for diagnosing, treating, ameliorating or preventing digestive disorders. Such conditions include disorders of the mouth, cespohagus, stomach, small include cancers of these organs and tissues. The tract and pancreas, and include cancers of these organs and tissues. The secreted proteins and their nucleic acids may also be used in the treatment of immune disorders, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying individuals from minute blological samples, as hybridisation probes, and secreted protein of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying individuals from minute construction may be used for chromosome and maxers. The present sequence represents a human secreted protein of the

The invention comprises the DNA and protein sequences of the extracellular region of human junctional adhesion molecules (huJAM). The extracellular huJAM DNA and protein sequences are useful in the treatment of: immune system disorders (e.g. immune deficiency); autoimmune disorders; inflammatory disorders; cancer; wound healing; or a cardiovascular disease. The present amino acid sequence represents the full-length membrane-bound huJAM2 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 LEWKKLGRSVSFVYYQQTLQGDFKNRAEMIDFNIRIKNVTRSDAGKYRCEVSAPSEQGQN 120

                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 LEWKKLGRSVSFVYYQQTLQGDFKNRAEMIDFNIRIKNVTRSDAGKYRCEVSAPSEQGQN 120

This invention describes a novel composition containing (apart from a carrier or excipient), a novel PRO245 polypeptide (I), its agonist or antagonist, or their fragments, for modulating: (i) infiltration of inflammatory cells into tissue; (ii) an immune response; or (iii) T cell proliferation. The composition increases or decreases any of the effects of inflammatory cells into tissue; (ii) an immune response; or (iii) T cell proliferation. The composition increases or decreases any of the effects of inflammane and anti-diabetic activity. (I), and its (ant) agonists and their fragments, are used to treat immune-related diseases, particularly T cell-mediated diseases. The diseases treated include systemic lupus erythematosus, rheumatorid arthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis (scleroderma), idiopathic inflammatory myopathies, systemic sclerosis (scleroderma), idiopathic inflammatory myopathies (dermatomyositis, polymyositis), Slogreni annume-mediated thrombocytopenia (idiopathic thrombocytopenic hemoglobinuria), autoimmune thrombocytopenia), thyroiditis (Grave's disease, Hashimoto's thyroiditis, juvenile lymphocytic thyroiditis, atrophic thyroiditis, diabetes mellitus, immune-mediated renal disease

CC thyroiditis), diabetes mellitus, immune-mediated renal disease

CC dlomerulonephritis, tubulointerstitial nephritis), multiple sclerosis, idiopathic demyelinating polyneuropathy, infectious hepatitis

CC inflammatory demyelinating polyneuropathy, infectious hepatitis

CHOMERIES, and sclerosing cholangitis, inflammatory bowel disease

CC ulcerative colitis: Crohn's disease), gluten-sensitive enteropathy, and wiliples diseases and enterone entimune-mediated skin disease including

The methods and compositions of the invention are useful for the treatment and diagnosis of inflammatory disease and tumours in mammals. Such inflammatory diseases include of inflammatory bowel disease, systemic lupus erythematosis, rheumatoid arthritis, juvenile chronic

N-PSDB; AAX52225

New isolated human genes and polypeptides used in, e.g. treatment of gastrointestinal ulceration

Claim 12; Fig 24; 320pp; English.

AAY13144-403 represent secreted and transmembrane human proteins.
The cDNA sequences are obtained from cDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina.
The encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal leibons [e.g. enterocolitis, Zollinger-Ellison syndrome, gastrointestinal ulceration and congenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus

Claim 33; Fig 16; 309pp; English

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, sograthis, idiopathic inflammatory myopathies, Sograths systemic sclerosis, idiopathic inflammatory myopathies, Sograths systemic vasculitis, arcoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune con immune-mediated skin diseases, allergic diseases, immunological diseases of the lung, and transplantation associated ARCS8739 to ARCS8739 to ARCS8739 to ARCS873 propresent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AACS8579 to ARCS842 and sequences and protein sequences given in the exemplification of the present invention.

Patent No. 5712369

GENERAL INFORMATION:

APPLICANT: Old, Lloyd J.; Welt, Sydney; Ritter, Gard;

APPLICANT: Simpson, Richard J.; Nice, Edouard; Moritz, R. L.;

APPLICANT: Catimel, B.; Ji, Hong; Burgess, Anthony W.;

APPLICANT: Heath, Joan K.; White, Sara J.; Johnstone, Cameron

TITLE OF INVENTION: Colon Cell And Colon Cancer Cell

TITLE OF INVENTION: Associated Nucleic Acid Molecules, Frotein And Peptides

NUMBER OF SEQUENCES: 29

CORRESPONDENCE SAPERS: Relfe & Lynch

STREET: 805 Third Avenue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               97; Indels 42; Gaps 11;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                     1521

FUNCTION: MAY PLAY A ROLE IN THE PROCESSES OF LYMPHOCYTE HOMING SECONDARY LYMPHOLD ORGANS.
SUBCELLULAR LOCATION: Type I membrane protein (Potential).
TISSUE SPECIFICITY: PROMINENTLY EXPRESSED ON HIGH ENDOTHELIAL VENULES BUT IS ALSO PRESENT ON THE ENDOTHELIA OF OTHER VESSELS.
LOCALIZED TO THE INTERCELLULAR BOUNDARIES OF HIGH ENDOTHELIAL
                                                                                                                  SIMILARITY: Contains 1 immunoglobulin-like V-type domain. SIMILARITY: Contains 1 immunoglobulin-like C2-type domain. DATABASE: NAME-EVGW; NOTE-PROW 2:1-3(2001); WWW-ncbi.nlm.nih.gov/prow/guide/1652492186_g.htm".

C -1-FUNCTION: Seems to plays a role in epithelial tight junction formation. Appears early in primordial forms of cell junctions and recruits PARD3. The association of the PARO5-PARD3 complex may prevent the interaction of PARD3 with JAM1, thereby preventing tight junction assembly (By similarity). Plays a role in regulating monocyte transmigration involved in integrity of epithelial barrier. Involved in platelet activation.

C -1-SUBUNIT: Interacts with the first PDZ domain of PARD3. The association between PARD3 and PARD6B probably disrupts this interaction (By similarity).

C -1-SUBCELLULAR LOCATION: Type I membrane protein (Potential).

C -1-TISSUE SPECIFICITY: Localized at tight junctions of both epithelial and endothelial cells.

C -1-SIMILARITY: BELONGS TO THE IMMONOGLOBULIN SUPERFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Combined treatment of TNF-alpha and IFN-gamma causes redistribution of junctional adheeion molecule in human endochelial cells.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  interaction.
SUBCELLULAR LOCATION: Type I membrane protein (Potential).
Localized at tight junctions of both epithelial and endothelial
